

Enviroguard Line

Forming and Sealing Machines for Meat, Produce & Beverage Operations

Our Enviroguard and stainless steel models are ideal for food packagers needing a degree of corrosion resistance for their packaging operation. The Enviroguard line of machines is designed to withstand splash from cleaning or caustic washdown environments common with food packaging or liquid packaging.

Semi-automatic forming & sealing systems

Wexxar/BEL semi-automatic systems provide improved productivity, ergonomics, and reduced costs—saving valuable floor space by eliminating cluttered packing lines and stacks of boxes littering the floor. An Enviroguard pack station with taper is ideal for sealing the top and bottom of the case, when machines are near a food packing area.

Fully automatic sealers & pack stations

Fully automatic sealers with forming pack stations are extensively constructed from type 304 stainless steel and other low-corrosion materials. Enviroguard sealers accept uniform case sizes and automatically fold the top flaps using unique and safe Snap Folder technology. Changes between case sizes are performed with 2 main adjustments: width and height. Cases are taped top and bottom with either 2" or 3" wide tape.

Fully automatic form, pack & seal systems

The Enviroguard form, pack, and seal systems not only make use of Wexxar's patented Pin & Dome forming technology, but also have a user friendly touch screen that provides easy setup and monitoring of all functions. The Enviroguard systems in glue or tape can be configured with varying levels of corrosion resistance, from light sprays to basic washdowns.

Fully automatic tray formers

Enviroguard fully automatic tray formers are designed and built to withstand the rigors of continuous, heavy-duty, industrial applications. The TF-200 Series will form regular slotted trays in various configurations including four corner glued trays, one and two piece telescoping trays, and variations of self-locking trays suitable for most any application including agricultural, food processing and distribution. It will continuously operate at speeds of up to 35 trays per minute and size changes are performed in 10 minutes or less.

Poly Bag Inserters

Enviroguard polybag inserters are resistant to regular sprays of water and provide a cost effective alternative to manually inserting poly bag liners into corrugated cases for bulk filling. The BEL 450 series features a vacuum system that draws the poly liner into all four corners of the box flush against the sides. This reduces operator contact with the inside of the box. It also automates manual bulk filling & sealing lines involving top and bottom or bottom only taping.
